Task 4 – Using an appropriate online tool create a prototype for a Flutter App

Using lucidchart, a prototype was created for a medical app as shown below whereby a sign in screen was represented as well as another screen for a new user account registration. Additionally, the successful sign in leads to the main options screen whereby the user is able to check various data such as health records and vitals along with other important options. Upon clicking on the user icon, the user is able to check his/her profile as shown in the screenshot for screen 5.
