Task 2 – Using an appropriate online tool create a wireframe for a Flutter App

Using Lucidchart, a wireframe for a mobile app was created, corresponding to a health app as shown below, representing the various parts and layout of the health app such as the logo and where text fields might be present along with any option which may be available. The wireframe was successfully designed since Lucidchart provides some templates for wireframes with components such as buttons, textboxes, menu items and images which can be browsed and inserted in the wireframe.
